SUMMARY

Software engineer and researcher with 5+ years building intelligent systems and production software end to end, from requirements through deployment. Currently shipping ride hailing apps used by real passengers, drivers, and mechanics, live on the Play Store and App Store. Strong foundation in React, Next.js, React Native, and TypeScript, with growing depth in Python based AI and machine learning, including PyTorch, deep learning, and natural language processing. Comfortable leading delivery, mentoring engineers, and shipping reliable software with precision.

EXPERIENCE

Software Engineer · Motion Ride PLC (Remote) 2025 – Present

- Build and maintain a ride hailing platform made up of two mobile apps, Motion App for passengers and Motion Pro for drivers and mechanics, both live on the Google Play Store and Apple App Store.
- Implemented the core ride flow where a passenger requests a trip, nearby drivers receive the call with the pickup location in real time, and the driver navigates to the passenger.
- Developed real time location tracking and driver to passenger matching, keeping trip state consistent across both apps during the ride lifecycle.
- Built role based access inside Motion Pro so mechanics log in to a dedicated module separate from the driver experience, on the same app.
- Work fully remotely with the team through the final polish phase, resolving edge cases and small production issues ahead of wider rollout.

Software Engineer · Kaeyros Analytics (Remote), Dortmund, Germany 2023 – 2025

- Led frontend development across most company projects, shipping 4+ products on time with high code quality.
- Mentored a team of developers, including two junior engineers, which lifted team productivity and sped up code reviews.
- Set up Git and GitHub workflows and code review standards that cut down bugs and regressions after launch.
- Owned the full frontend lifecycle, from project setup to production launch, working with UI/UX on wireframes and prototypes to keep designs accurate.
- Ran client discovery sessions to turn stakeholder needs into clear technical specs, reducing confusion and rework.

Software Engineer · Nobisoft (On-site), Yaoundé, Cameroon 2022 – 2023

- Led projects from start to finish, covering requirements, planning, and delivery, while keeping client goals aligned with the business.
- Designed a microservices setup connecting 5+ services, with a focus on scaling and clean coordination.
- Owned deployment and technical documentation, making handoffs smooth and the system easy to maintain.
- Built an e-commerce platform with a live blog that updated on its own as product and promotion data changed.

SELECTED PROJECTS

Motion App and Motion Pro · Ride hailing platform, live in production

Passenger, driver, and mechanic apps published on the Play Store and App Store. Covers ride requests, real time driver location, trip matching, and a separate mechanic role inside the driver app.

Velocaris · E-commerce platform

A full e-commerce platform with product catalog, cart, and checkout. Admins manage products and orders from a dashboard, while regular users create their own accounts and shop directly on the site.

Report Card · School reporting platform

A web platform for managing student report cards, with separate roles for administrators and class masters to record grades and generate reports.

MiQ · Discrimination reporting and mapping platform

A platform where people who have faced discrimination can report incidents. Reports are mapped by location to show areas with higher concentrations of discrimination, turning individual reports into clear, actionable data.

0+1 Festival · Event and attendance platform

An event platform for a diversity and complexity festival, where people register through the website to attend. Led roughly 80% of development with a focus on user experience and a smooth booking flow.

GPT From Scratch, with a RoPE ablation · In progress

A GPT style transformer language model built from scratch in pure PyTorch, with no Hugging Face transformers library. Trains a baseline model with learned positional embeddings alongside a variant using Rotary Position Embeddings (RoPE), then compares the two on validation perplexity and sample text generations.

SKILLS

Languages: JavaScript, TypeScript, Python, C++, C, PHP

Frontend and Mobile: React, Next.js, React Native, Redux, HTML & CSS, Tailwind CSS

Backend: Node.js, Express, NestJS, REST APIs

Databases: PostgreSQL, MongoDB, MySQL, Prisma

AI & Machine Learning: PyTorch, Deep Learning, Machine Learning, Natural Language Processing, Artificial Intelligence Systems

Tools: Git, GitHub, GitLab, Socket.io, Mapbox, Figma

EDUCATION

Higher National Diploma · CITEC HITM, Yaoundé, Cameroon

2019 – 2022

CERTIFICATIONS

Frontend Developer Certification · Scrimba, Norway

2021 – 2022

80 hour program covering HTML, CSS, JavaScript, React, Git, and Next.js applied across real world frontend builds.
